

Please read the manual thoroughly and make sure you follow these instructions step by step to make sure you proceed in the easiest way possible.

This is a two person manual, two is the ideal number of people for the job.

Should there be only one person to erect the shelter or should it prove too difficult to erect according to this manual it might be necessary to either keep the canopy off the frame, until finished with step 6 or at least unscrew the bolts holding the canopy on the frame and roll the canopy up and off the corners.

- 1** Place the shelter in the middle of the area where it is going to be erected.

- 2** Open the marquee by pulling two opposite legs away from each other.

- 3** Roll the canopy over the corner joints to decrease the tension.

- 4** Grab the concertina sections on two opposite sides, lift slightly off the ground to prevent friction and walk away from each other.

- 5** Take the upper and the bottom part of the side section right in the center and squash towards each other.

- 6** Get inside underneath the canopy and squash the central spider while the other person lifts the corner joints up until all four are locked in position.

- 7** Roll the canopy back down on the corners

- 8** Grab the two corner legs on the same side, lift the shelter up and release the joint at the bottom of each leg. After the inner part of the leg slides out, lock in one of the five heights. The total height can be adjusted any time after. Now release the joint on the middle leg (only relevant for six legged units).

- 10** Adjust the total height according to your liking.

- 11** It is absolutely crucial the shelter is properly anchored to prevent any problems! Use stakes and guy ropes!

- 9** Do the same on the other side.
